the area around thomas and hawes would drain out the griffith outfall before the construction of the yosemite box in 1989. that area never was drained very well and its possible that much of the drainage from that site before the box was built would have been via overland flow to the yosemite slough (ie we wouldnt have been the transporter.

it raises the question, if the main areas that are contaminated are at the foot of hawes street in the slough, then its from overland flow, if the main contaminated area is off griffith st where our outfall has been since 1910s then we cant make that claim.

The 20' box on Hawes and turns east on Thomas.

Then 4'x6' on Thomas and turns north on Hawes.

See map.

Chung, please provide the sewer information to Arleen.

Thanks,
Ken
